

JavaScript Hands-On Project 4

In this project, you'll continue your work on the validation code you worked on in the previous project. Next you'll convert the event listener code from plain JavaScript to jQuery.

1. In the file manager for your operating system, copy the completed contents of the HandsOnProject 3 folder to the HandsOnProject folder 4
2. In your text editor, open the **index.html** and **results.html** files from the HandsOnProject 3 folder. In each file, change "Hands-On Project 3" to **Hands-On Project 4** in the comment section, in the `title` element, and in the `h1` element. Save your changes to both files and then close results.html.
3. In your text editor, open the **script.js** file from the HandsOnProject 4 folder, change "Hands-On Project 3" to **Hands-On Project 4** in the comment section, and then save your changes.
4. In the **script.js** file, at the bottom of the file, comment out the six lines of code that create event listeners, and then below the commented code, add the following replacement statement:

```
$("#submitBtn").click(validateForm);
```
5. Save your changes to script.js, open index.htm in your browser from the HandsOnProject 4 folder, and then repeat Steps and from Hands-On Project 3 to verify that the validation function still works as expected.
